# Stakeholder Analysis

| Stakeholder                                     | Needs and Executions                                                                                                                                        |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Legal Authorities<br>Police, Emergency Services | High accuracy (low false alarms), real time alerts with precise location data, and video evidence for prosecution.                                          |
| Schools & Universities                          | Rapid detection of fighting or vandalism, integration with existing security hardware, and maintaining a safe campus without needing a 24/7 human watching. |
| Parents                                         | Assurance of child safety, and immediate notification in life threatening scenarios.                                                                        |
| System Administrators                           | Easy to use dashboard, low latency, and scalable architecture to handle multiple camera feeds simultaneously.                                               |

## User Stories & Use Cases

### User Stories

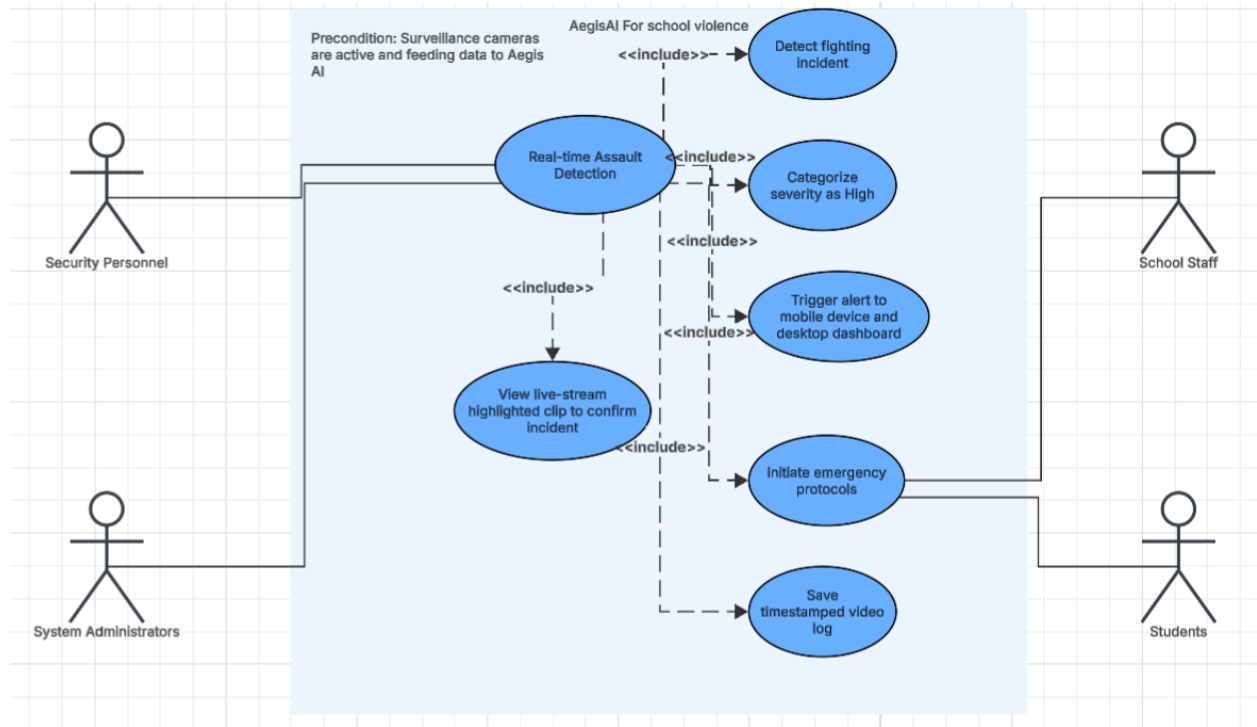

**As a Police Officer:** I want the system to automatically flag "Shooting" , "Explosion" incidents or any violation with a live video feed, so that I can send the correct tactical unit to the scene without waiting for a call.

**As a School Principal:** I want to be notified of "Vandalism" or "Fighting" on campus after seconds so that I can prevent property damage and student injury.

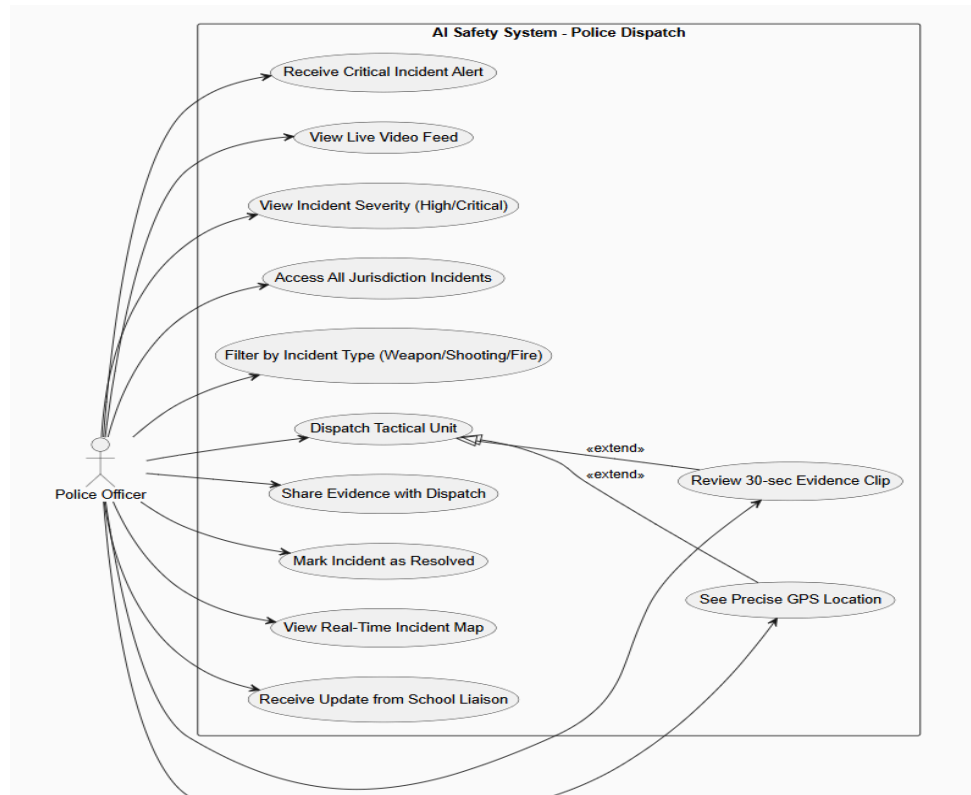

**As a Parent:** I want to know that the AI is monitoring the surrounding environment for "Abduction" or "Weapon" threats to ensure my child is in a secure environment.

### User case

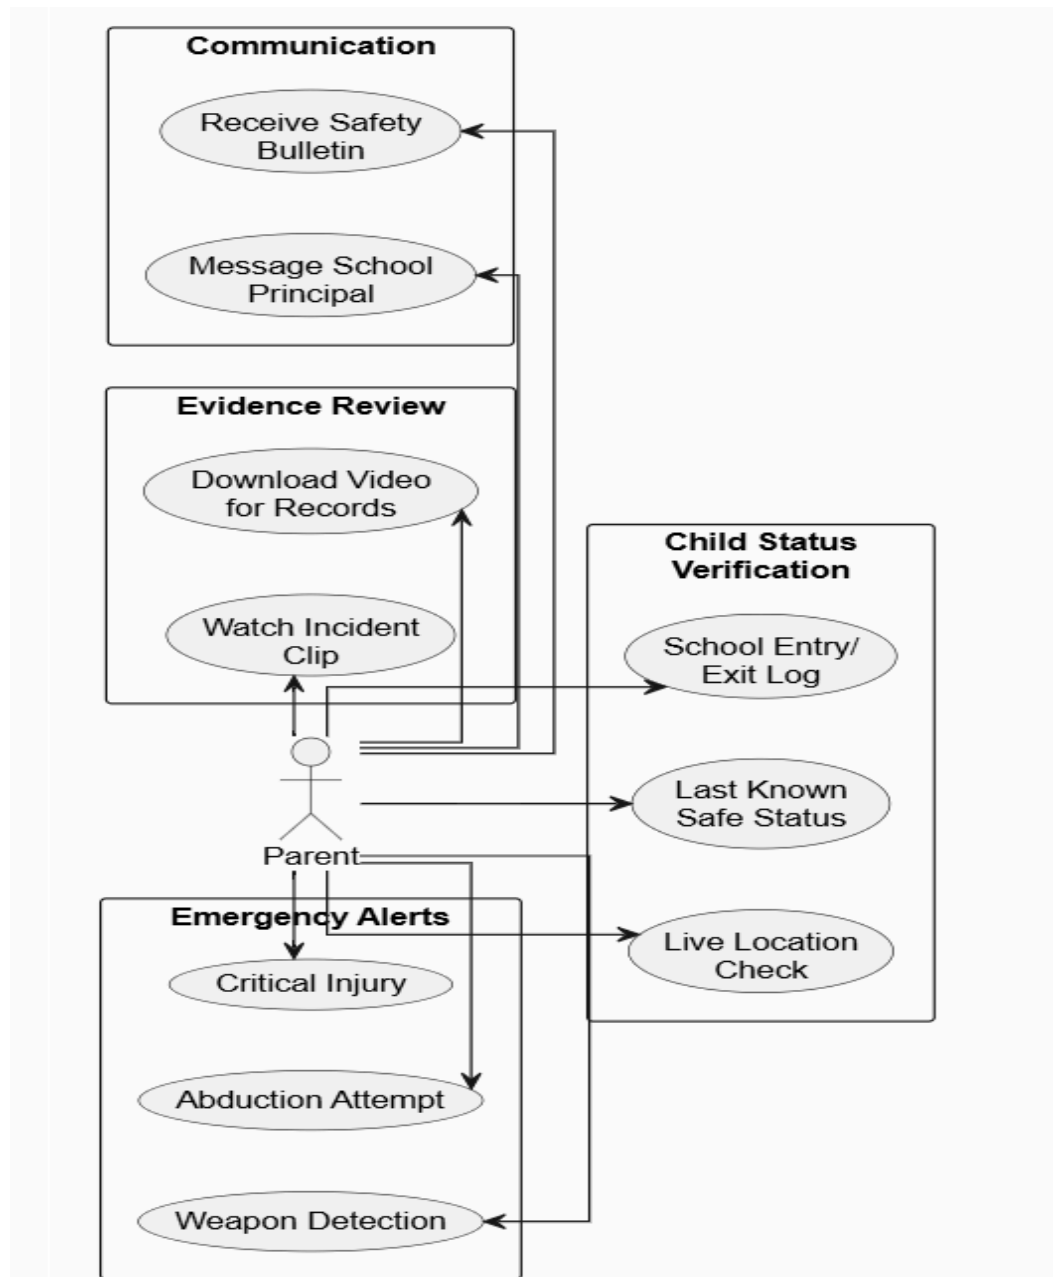

School Violence:

Incident:

Parents:

## Functional Requirements FRs

**FR-1: Real time Detection:** The system shall detect 13+ specific incidents (Abuse, Arson, Robbery, etc.) in a few seconds of the event occurring.

**FR-2: Severity Categorization:** The system shall automatically label incidents as Low, Medium, or High priority based on the nature of the detected action.

**FR-3: Alert Triggering:** The system shall send multi channel notifications (SMS, Email, Dashboard Push) to designated stakeholders when a threat is identified.

**FR-4: Dashboard & Analytics:** The system shall provide a web based UI to view live feeds, historical incident logs, and frequency heatmaps.

**FR-5: Archiving:** The system shall automatically clip and store 30 seconds of video prior to and after a detected incident for legal evidence.

## Non Functional Requirements NFRs

**Performance:** The system must process video frames at a minimum of 15 FPS (Frames Per Second) to ensure "real time" accuracy.

**Security:** All video data must be encrypted to prevent unauthorized access or tampering.

**Reliability:** The platform must maintain uptime, as failure to detect a crime could have life critical consequences.

**Scalability:** The architecture must support an increase in camera feeds without a significant drop in detection speed.
